In the Claims:

1-14. (Canceled)

15. (Withdrawn): A method for unit channelization in a liquid crystal display system, said method comprising:

providing a plurality of individual liquid crystal display units, each of said units able to display data;

arranging said units in a tiled-configuration;

substantially encasing said units in a structural support system, said structural support system having a transparent cover to facilitate viewing of said units;

grouping said units to form at least one channel, said channel having a processor and a power source to control the operation and data display of said units, each of said units able to simultaneously display different data; and

redirecting data between units to provide data redundancy.

- 16. (Withdrawn): The method for unit channelization of claim 15, further comprising the step of simultaneously displaying substantially the same data on two units.
- 17. (Withdrawn): The method for unit channelization of claim 15, wherein said redirecting step further comprises redirecting data from a faulty unit to an operational unit.
- 18. (Withdrawn): The method for unit channelization of claim 17, further comprising the step of displaying said redirected data on said operational unit.
- 19. (Withdrawn): The method for unit channelization of claim 15, wherein said arranging step comprises forming a top display section and a bottom display section.

- 20. (Withdrawn): The method for unit channelization of claim 19, wherein said grouping step comprises forming two channels.
- 21. (Withdrawn): The method for unit channelization of claim 20, wherein said providing step comprises four liquid crystal display units.
 - 22. (Withdrawn): An aircraft instrument display panel comprising:
 - a plurality of LCD units in a tiled-configuration, each of said units configured to simultaneously display different data;
 - a supporting mechanism including a screen divider placed over said units and a carrier having an equal number of depositories as said units;
 - a transparent cover atop said units;
 - a frame structure surrounding said cover, said supporting mechanism, and said units; and
 - a channelization system comprising a plurality of channels, said channels coupled to one or more of said units to form a channel group, said channel group controlling said data display of said units in said group and providing a redundant data display.
- 23. (Withdrawn): The aircraft instrument display panel of claim 22, further comprising a manual control feature on said frame structure, said manual control feature coupled; to said channelization system.
- 24. (Withdrawn): The aircraft instrument display panel of claim 22, wherein said screen divider comprises a dark color.
- 25. (Withdrawn): The aircraft instrument display panel of claim 22, wherein said frame structure comprises a bezel connected to a backplate.

- 26. (Withdrawn): The aircraft instrument display panel of claim 25, wherein said backplate comprises an equal number of slots as said units.
- 27. (Withdrawn): The aircraft instrument display panel of claim 25, wherein said slot providing electro/mechanical routing to said unit.
- 28. (Withdrawn): The aircraft instrument display panel of claim 22, wherein said redundant data display comprises redirecting data from one unit to another unit.
- 29. (Withdrawn): The aircraft instrument display panel of claim 22, comprising four liquid crystal units and said tiled-configuration comprises a substantially square shape.
 - 30. (Currently Amended): A liquid crystal display system comprising:
 - four autonomous liquid crystal display units arranged adjacent to each other, each of the liquid crystal display units includes an array of lighting elements;
 - a housing comprising a structural support system and a transparent cover, said housing substantially surrounding said units; and
 - a channelization system in communication with said units, said channelization system comprising:
 - a first channel processor coupled to first and second data sources and to first and second liquid crystal display units; and
 - a second channel processor coupled to the first and second data sources and to third and fourth liquid crystal display units,
 - wherein the first and second channel processors control the data from the data sources to present on the respectfully respectively coupled displays.
- 31. (Original): The system of Claim 30, wherein said structural support system comprises a frame secured to a cavity and enclosing said transparent cover and said units.

- 32. (Original): The system of Claim 31, wherein said structural support system further comprises a carrier having said units disposed therein.
- 33. (Original): The system of Claim 31, wherein said structural support system further comprises a screen divider between said cover and said units.
- 34. (Original): The system of Claim 30, wherein said channel display processors display data from the same data source.
- 35. (Currently Amended): The system of Claim 30, wherein said arranged <u>liquid crystal</u> display units comprise top <u>liquid crystal</u> display units and bottom <u>liquid crystal</u> display units.
- 36. (Currently Amended): The system of Claim 35, wherein the top <u>liquid crystal</u> display units include the first and second <u>liquid crystal</u> display units.
- 37. (Currently Amended): The system of Claim 35, wherein the bottom <u>liquid crystal</u> display units include the first and second <u>liquid crystal</u> display units.
- 38. (Currently Amended): The system of Claim 35, wherein the top <u>liquid crystal</u> display units include the first <u>liquid crystal</u> display unit and the bottom display units includes the second <u>liquid crystal</u> display unit.
- 39. (Currently Amended): The system of Claim 35, wherein the top <u>liquid crystal</u> display units include the second <u>liquid crystal</u> display unit and the bottom display units includes the first <u>liquid crystal</u> display unit.
